

However, to model the PV panels comprehensively, it is necessary to determine other physical parameters, e.g., series resistance of PV cell (R_s), shunt resistance of PV cell (R_{sh}) and diode ideality factor (n). This paper presents a generalised mathematical model of a PV panel utilising only the quantities provided in manufacturer's datasheet.

This article presents an accurate computational technique for estimating the photovoltaic (PV) cell parameters from experimental measurements of the current-voltage (I-V) characteristics. The technique is based on using various evolutionary algorithms (EAs) and the double-diode eight-parameter cell model to precisely estimate unknown parameters.
