solar water heating system won't provide 100% of the hot water required throughout the year.

When the sun shines on a solar panel, solar energy is absorbed by individual PV cells. These cells are made from layers of semi-conducting material, most commonly silicon. The PV cells produce an electrical charge as they become energised by the sunlight. The stronger the sunshine, the more electricity generated.

They rely on light, not heat, to generate electricity. Although solar panel output reduces by an average of 83% during winter compared to summer, they continue to produce electricity as long as they receive direct or indirect sunlight. On the other hand, solar battery systems serve as a vital energy storage component in solar energy systems.

Additionally, government incentives and subsidies for renewable energy make solar panel installation more cost-effective than ever. These financial benefits, coupled with the potential for a faster return on investment, make this the perfect opportunity to power your cold storage operations with clean, reliable solar energy.
