In the case of 24V batteries, there is no issue when a string of 2 or more panels is connected in series, but there is a problem when only one solar panel is connected. Most common (24V) 60-cell solar panels have a V_{mp} of 32V to 36V - While this is higher than the battery charging voltage of around 28V, the problem occurs on a very hot day when the panel ...

Finding an unshaded spot is best, but sometimes shading is unavoidable. Some solar panel systems can minimise the impact of shading using "optimisers". Solar optimisers help improve the overall performance of your solar panel system. So, if one panel is shaded, it doesn't impact how much electricity the other panels can generate.

However, to truly harness the potential of solar energy, connecting the solar panels to an inverter is essential. The inverter serves as the heart of the solar power system, converting the direct current (DC) electricity produced by the solar panels into alternating current (AC) electricity, which is suitable for powering homes and businesses.

Why You Shouldn't Connect Solar Panel to Battery Directly. The short answer is: in most cases, it can overcharge and fry your battery. Let's take a 12 Volt lead-acid battery. It needs 13.5 to 14 volts to charge properly. Now you have your good old 12-volt solar panel. And you decide to connect it directly.
