

To whom is the photovoltaic (PV) guide applicable?

This guide is applicable to Clients planning or undertaking installation of Photovoltaic (PV) systems on 'Large Scale' buildings. These buildings are typically owned by organisations from the public or private sector, such as educational establishments, local government, a local community, or commercial organisations.

How to plan a PV installation?

Surface Area: The surface area of the site at which the PV installation is intended should be known, to have an estimation of the size and number of panels required to generate the required power output for the load. This also helps to plan the installation of inverter, converters, and battery banks.

How can a community solar system be implemented?

Programming can serve to eliminate the incidental barriers to community solar created by other policies, like securities laws. Publicly owned utilities are often considered to be a more favorable environment for implementing community solar.

Can a community solar program be implemented in the USA?

Implementing a community solar program in the USA requires two accommodations: the ability to share the output of one solar installation across multiple subscribers and the ability to connect to the grid. For the most part, legislation makes these allowances.

Is there a model for community solar?

There is no absolute model when it comes to community solar, but certain models do better to serve owners, subscribers, and the community. In puzzle form, Fig. 9 delineates the intricate web of players and technologies that interface to make community solar a reality.

What is community solar?

Community solar is an umbrella term that encompasses many different models. The community solar featured in this chapter is different from "community solar installations" that are owned by a utility, or others, where passive participants are consumers without control over decision-making. The passive model is sometimes called "shared solar."

My PV Solar Panels are connected to the PowerVault Battery using an AC-input configuration. Let's calculate this using generous efficiencies of 94% for AC-to-DC (charge) and 90% for DC-to-AC (discharge) cycles. For each 1kWh generated by the PV Panels,  $1 \times 0.9 \times 0.94 = 846\text{w}$  ends up in the battery. To retrieve that back into the home I get  $846 \times 0.9$  ...
