1 Introduction. Cooling technologies have been important since ancient times, and many novel technologies have been developed. However, most current cooling systems rely on vapor compression, necessitating the use of refrigerants and external energy; and therefore, raising environmental concerns.

Pumped-storage hydroelectric dams, rechargeable batteries, thermal storage, such as molten salts, which can store and release large amounts of heat energy efficiently, compressed air energy storage, flywheels, cryogenic systems, and superconducting magnetic coils are all examples of storage that produce electricity.

Even though each thermal energy source has its specific context, TES is a critical function that enables energy conservation across all main thermal energy sources [5]. In Europe, it has been predicted that over 1.4 &#215; 10<sup>15</sup> Wh/year can be stored, and 4 &#215; 10<sup>11</sup> kg of CO<sub>2</sub> releases are prevented in buildings and manufacturing areas by extensive usage of heat and ...

An energy-storage system (ESS) is a facility connected to a grid that serves as a buffer of that grid to store the surplus energy temporarily and to balance a mismatch between demand and supply in the grid [1]. Because of a major increase in renewable energy penetration, the demand for ESS surges greatly [2]. Among ESS of various types, a battery energy storage ...

Phase change materials have emerged as a promising passive cooling method in battery thermal management systems, offering unique benefits and potential for improving the overall performance of energy storage devices [77].
