The diagram should include: array breaker for use by the location, size, orientation, conduit size and location and balance of system solar PV system. component locations.

How does a photovoltaic system work?

Photovoltaic (PV) systems (or PV systems) convert sunlight into electricity using semiconductor materials. A photovoltaic system does not need bright sunlight in order to operate. It can also generate electricity on cloudy and rainy days from reflected sunlight. PV systems can be designed as Stand-alone or grid-connected systems.

$N \text{ modules} = \text{Total size of the PV array (W)} / \text{Rating of selected panels in peak-watts}$. Suppose, in our case the load is 3000 Wh/per day. To know the needed total W Peak of a solar panel capacity, we use PFG factor i.e. $\text{Total W Peak of PV panel capacity} = 3000 / 3.2 \text{ (PFG)} = 931 \text{ W Peak}$. Now, the required number of PV panels are $= 931 / 160\text{W} = 5.8$.
