A key parameter for energy storage systems is round-trip efficiency which is defined as the ratio of energy used to the energy stored and reflects the irreversible losses in the system. One of the most successful and widely deployed energy storage technology is the electrochemical energy storage system.

The pseudocapacitors incorporate all features to allow the power supply to be balanced. The load and discharge rates are high and can store far more power than a supercapacitor. Electrochemical energy storage is based on systems that can be used to view high energy density (batteries) or power density (electrochemical condensers).

Urban Energy Storage and Sector Coupling. Ingo Stadler, Michael Sterner, in Urban Energy Transition (Second Edition), 2018. Electrochemical Storage Systems. In electrochemical energy storage systems such as batteries or accumulators, the energy is stored in chemical form in the electrode materials, or in the case of redox flow batteries, in the charge carriers.
