

What is the optimal capacity planning model of microgrid?

The optimal capacity planning model of microgrid with different forms of renewable generation is developed based on the scenario generation method considering energy management strategy under multi-dimensional uncertainties.

How can a microgrid improve capacity planning?

The modeling of the uncertainties of power generation and demand is fundamental for the optimal capacity planning of microgrids.

How to plan a grid-connected microgrid?

The grid-connected microgrid needs to carry out reasonable planning methods from the aspects of system structure, power supply composition and capacity ratio according to the actual situation.

Is there a capacity planning solution for grid-connected microgrid based on scenario generation?

This paper presented an optimal capacity planning solution for grid-connected microgrid based on scenario generation considering multi-dimensional uncertainties. The efficient DCGAN based scenario generation method is developed to describe the uncertain behaviors of renewable power generation.

Can microgrids be used in transmission-level resource planning?

The combination of these developments identifies benefits that microgrids can provide within many aspects of distribution planning. Ultimately, this development will enable microgrids to be included within transmission-level resource planning such as integrated resource planning processes.

Why is dcgan used in microgrid capacity planning?

The DCGAN is adopted for scenario generation to produce a sufficient number of power generation scenarios to cover the diverse system operational patterns. These scenarios are further clustered as a set of representative scenarios that are incorporated into the optimization process to obtain the robust microgrid capacity planning solution.

The rural microgrid construction plan delineated in this study, Scheme 3, thoughtfully balances business costs and customer satisfaction by using 17 PV sets and 12 wind turbines.

By 2035, microgrids are envisioned to be essential building blocks of the future electricity delivery system to support resilience, decarbonization, and affordability. Microgrids will be increasingly

remote microgrids. Markovitz (mean-variance) objective function is adopted in [12] in the one-level method framework to minimize risk in microgrid planning. Differential evolution method is used ...
