

Can a Switched Reluctance Generator be used in variable speed wind generation?

In this paper, algorithms are proposed to get optimal parameters of a switched reluctance generator (SRG) when applied in variable speed wind generation systems. The driver's parameters affect power generated, torque ripples, iron losses, and electric losses.

What is a Switched Reluctance Generator (SRG)?

Switched reluctance generators (SRGs) come into prominence in other electrical machines with its simple structure, only stator winding, reliability, high fault tolerance and the possibility of working within wide speed range.

What is dynamic model of wind turbine-driven Switched Reluctance Generator?

Dynamic model of wind turbine-driven switched reluctance generator Wind turbine is a machine that converts wind kinetic energy into mechanical energy. The mechanical torque, T_m , applied to the wind turbine shaft is given below.

Which generator is used in a variable speed wind turbine (WCES)?

Recently, the variable speed wind turbine is preferred in WCES due to their high efficiency. In variable speed WCES, doubly fed induction generator (DFIG), permanent magnet synchronous generator (PMSG) and switched reluctance generator (SRG) are used as generator.

What is a Switched Reluctance Generator?

... Switched Reluctance Generators (SRGs) are simple electrical machines since they have a stator and rotor with salient poles and only windings on the stator, there are no windings or permanent magnets on the rotor.

Why do wind power plants use variable speed generators?

These generators are used especially in wind power plants due to their ability to operate in variable speed range and applications of aviation and electric cars. In this study, the control of the SRG was performed.

(7.9.6) When firefighters respond to a fire, they shut off the main gas supply to a building. Shutting off the main valve would inadvertently turn off the fuel supply to the emergency generator, leaving the EPS without fuel. One of the more controversial requirements of NFPA 110 is the requirement for 96 hours of fuel capacity for Level 1 systems.
