Around 75% of the PV systems installed in the world are grid connected . In the grid-connected PV system, DC-AC converters (inverters) need to realize the grid interconnection, inverting the dc current that comes from the PV array into a sinusoidal waveform synchronized with the utility grid [2, 3].

Solar inverters are a key component of any solar power system, they convert DC power from the panels into AC power output that can be used by household appliances. However, solar inverters can sometimes overheat,

and this can cause a number of problems. Overheating can damage the inverter itself, reducing its lifespan and performance.

To minimise the number of power converters, Enec-sys has slightly modified the basic inverter configuration using a "duo micro-inverter" to integrate two P-connected PV modules to the utility grid using a single power converter . In countries where there is no tight regulation on load isolation and leakage ground currents, the transformer-less inverter has the highest ...

In this study, a two-stage grid-connected inverter is proposed for photovoltaic (PV) systems. The proposed system consist of a single-ended primary-inductor converter (SEPIC) converter which tracks the maximum power point of the PV system and a three-phase voltage source inverter (VSI) with LCL filter to export the PV supplied energy to the grid. The incremental conductance ...

In grid-connected photovoltaic (PV) systems, power quality and voltage control are necessary, particularly under unbalanced grid conditions. These conditions frequently lead to double-line frequency power oscillations, which worsen Direct Current (DC)-link voltage ripples and stress DC-link capacitors. The well-known dq frame vector control technique, which is ...
