How do battery energy storage systems work? Simply put, utility-scale battery storage systems work by storing energy in rechargeable batteries and releasing it into the grid at a later time to deliver electricity or other grid services. Without energy storage, electricity must be produced and consumed at exactly the same time.

A battery management system (BMS) controls how the storage system will be used and a BMS that utilizes advanced physics-based models will offer for much more robust operation of the storage system.

The move towards larger energy storage systems brings significant cost advantages. As the size of the storage system increases, the cost per unit of stored energy tends to decrease. This means customers can expect more storage capacity for their investment, making large-scale energy storage projects more financially viable and attractive.
