Racks of modules can be clamped firmly to the seams without creating penetrations. With an engineered product such as Metal Roof Innovations" S-5!, designed for snow fences and other roof attachments, the connection can meet specific wind uplift and load ratings. "Metal is simply the best substrate for photovoltaic installations," says Paner.

Silver Grid and Plate. The top metal conductor is a grid, while the back is a plate. The former is a grid because it needs space for the incoming light. Having too little space won't allow the light to pass through to the silicon, and if there's too much space then the electrons will have to travel a far distance along with the silicon. On ...

The photovoltaic effect is a process that generates voltage or electric current in a photovoltaic cell when it is exposed to sunlight. These solar cells are composed of two different types of semiconductors--a p-type and an n-type--that are joined together to create a p-n junction joining these two types of semiconductors, an electric field is formed in the region of the ...
