Search 222,191,554 papers from all fields of science ... which considers the cluster heads selection, data collection satisfaction and sensor association. Expand

Control of a microgrid is a complex task and requires sophisticated communication and monitoring for reliable operation. This paper presents a microgrid specific low-cost data acquisition system ...

DC microgrids have high efficiency, better reliability and compatibility and simple controlling strategy [1, 2]. The use of DC microgrid for direct feeding of DC loads eliminates the utilization of inverters in power grids that prevent approximately 7%-15% of power loss of intact system [1]. DC microgrids are robust, resilient and having very simple control design with higher ...

The project's development encompassed six stages: 1 - selection of the data collection instrument; 2 - formulation of a questionnaire with closed-ended questions; 3 - creation of an ...

There are high numbers of remote villages that still need electrification in some countries. Extension of the central electrical power network to these villages is not viable owing to the high costs and power losses involved. Isolated power systems such as rural microgrids based on renewables could be a potential solution. Photovoltaics (PV) technology is particularly ...

This assessment aims to design and evaluate the performance of a grid-connected microgrid system comprising of photovoltaic (PV) arrays, wind energy generating units and battery energy storage system (BESS). The realistic load data of a small village, Tandwal, located in Ambala district of Haryana, India, is considered for this assessment.

The investment economy of microgrid (MG) construction is one of the key factors affecting its popularization and application. Therefore, it is important to provide a design scheme that is economically attractive with lower investment costs and a shorter payback period for the stakeholders, which requires an efficient planning and design tool to optimize the composition ...

Microgrid planning and design is to determine the construction scheme satisfying the power demand, with comprehensive considerations of the load profile, distributed energy resource (DER) operating condition, and system status []. Different from the planning of utility power grid, the planning and design of microgrid is highly coupled with the operation ...

Microgrids can produce energy at a lower cost than diesel generators or grid extensions schemes. Access to

reliable electricity in sufficient quantity can be used appropriately in productive activities so that community members attain better income, and sustainable development is promoted.

etc.; microgrids supporting local loads, to providing grid services and participating in markets. This white paper focuses on tools that support design, planning and operation of microgrids (or aggregations of microgrids) for multiple needs and stakeholders (e.g., utilities, developers, aggregators, and campuses/installations).

Such type of reliability analysis will be useful for protection schemes in microgrids. 3.4 Adaptivity. The adaptivity of the microgrid protection scheme is the new requirement that is the ability of the protection scheme to adapt its settings according to changing operational modes from the grid-connected to an islanded mode and vice versa.

N2 - Protecting an inverter-dominated microgrid is challenging for the traditional overcurrent protection scheme owing to the suppressed fault current from the inverter interfaced DGs (IIDGs). In this paper, a protection scheme based on the Discrete Wavelet Transform is developed in MATLAB/SIMULINK to detect the faults in the microgrid.

reflect a wide range of variability and regional distribution in microgrid design in the United States, in particular: (1) more than 50% of operational microgrids are located in states in the East Coast and West Coast, and (2) regional hot spots include California, the Northeast, and Alaska.

Following a review of microgrid protection system design challenges, this paper discusses a few real-world experiences, based on the authors' own engineering, design, and field experience, in ...

Design of Microgrid Protection Schemes Using PSCAD/EMTDC and ETAP Programs ... the ETAP program by creating a complete and accurate electric power system modeling by integrating power circuit data ...

paper focuses on tools that support design, planning and operation of microgrids (or aggregations of microgrids) for multiple needs and stakeholders (e.g., utilities, developers, aggregators, and

Thus, the performance of microgrid, which depends on the function of these resources, is also changed. 96, 97 Microgrid can improve the stability, reliability, quality, and security of the conventional distribution systems, that it is the ...

privacy protection scheme based on a microgrid design. The. ... cloud computing can be adopted to support high-performance tasks with centralized data collection. However, frequently communicating ...

The framework guides a community through data collection and a high-level assessment of its needs, constraints, and priorities, prior to engaging engineers, vendors, and contractors. ... Going through this exercise and developing the conceptual microgrid design as a community ensures the same community

members who will ultimately live with the ...

DESIGN AND OPTIMIZATION OF A RENEWABLE ENERGY BASED SMART MICROGRID FOR RURAL ELECTRIFICATION A THESIS SUBMITTED TO THE UNIVERSITY OF MANCHESTER FOR THE DEGREE OF DOCTOR OF PHILOSOPHY IN THE FACULTY OF SCIENCE & ENGINEERING 2020 Jane Namaganda-Kiyimba Department of Electrical and Electronic ...

This paper designs a transaction security microgrid power transaction scheme based on Hyperledger fabric. Compared with most schemes that only have the function of predictive power trading, we design two trading modes, predictive power trading and reserve power trading, which are carried out simultaneously through different channels of Fabric.

Real-time acquisition of microgrid (MG) operation data and remote control play a crucial role in the safe and stable operation of MG. A design scheme of monitoring system is proposed for the wind/photovoltaic/energy storage islanded direct current MG.

distributed generation systems, in the form of microgrids, are providing much-needed stability to an aging power grid. A facility's energy demand is key to the design of a microgrid system. To ensure efficiency and resiliency, microgrids combine different components to meet a given demand, while optimizing costs. Key components

System configuration and design, safety, energy measurement and control, and scheme evaluation are some of the methodologies, factors, and best practices to take into account while planning and developing microgrids (grid-connected or stand-alone) [5]. These variables aid in offering technical criteria and requirements to guarantee the security, ...
