What is a photovoltaic/thermal (pv/T) system?

A photovoltaic/thermal (PV/T) system converts solar radiation into electrical and thermal energy. The incorporation of thermal collectors with PV technology can increase the overall efficiency of a PV system as thermal energy is produced as a by-product of the production of electrical energy.

How can a photovoltaic system be integrated into a network?

For photovoltaic (PV) systems to become fully integrated into networks, efficient and cost-effective energy storage systems must be utilized together with intelligent demand side management.

How can thermal collectors improve the efficiency of a PV system?

The incorporation of thermal collectors with PV technology can increase the overall efficiency of a PV system as thermal energy is produced as a by-product of the production of electrical energy. Passive cooling is a buoyancy-driven and the use of an external mechanical system is known as active or forced cooling.

Why is PV technology integrated with energy storage important?

PV technology integrated with energy storage is necessary to store excess PV power generated for later use when required. Energy storage can help power networks withstand peaks in demand allowing transmission and distribution grids to operate efficiently.

Nuclear energy is seen by society there as a green, emission-free source of energy. However, we are noticing a growing interest in wind and solar energy through our national organisation. To accelerate the expansion of the grid, balancing energy is required, which can be provided by gas-fired power plants or batteries, for example.
