Is wavelet fuzzy based controller suitable for single-phase PV inverter system?

Conclusion The work presented in this paper develops a wavelet fuzzy based controller for standalone operation of single-phase PV inverter system. The proposed system is simulated in MATLAB/Simulink environment and evaluated for Voltage regulation and THD with varying linear and nonlinear loads.

Can PV inverters be controlled in voltage control mode?

However, when the main grid is cut off from the PV system, standalone operation must be achieved while operating in voltage control mode. This brings new challenges for the control of PV inverters, i.e., voltage regulation and harmonic elimination.

What is the THD of a photovoltaic system?

The THD of the proposed system operating with linear loads is observed to be 2.18%, and for nonlinear loads, it is around 2.71% under simulation conditions. The implementation of photovoltaic (PV) systems in the power grid is accepted on a wide scale due to the development in technology aiding for clean energy, and environmental safety.

How to test a single-phase standalone PV system?

To assess the action of the developed controller on a single-phase standalone PV system, experimental tests are carried out by using the laboratory setup. The PV arrays with the rated power of 1 kW are realized by using a PV simulator, which can emulate the behavior of the PV arrays according to the PV cell parameters and the irradiance profile.

How is a 1 kW rated PV array realized?

The PV arrays with the rated power of 1 kW are realized by using a PV simulator, which can emulate the behavior of the PV arrays according to the PV cell parameters and the irradiance profile. The parameters of the single-phase standalone PV system can be found in Table 1.

When should a PV inverter be able to disconnect from the grid?

Whenever a grid fault occurs or during grid maintenance, the PV inverter should be able to disconnect the PV system from the grid and support its local load by operating in standalone mode, as allowed by the grid utility manager to minimize outages.

In grid-connected photovoltaic (PV) systems, power quality and voltage control are necessary, particularly under unbalanced grid conditions. These conditions frequently lead to double-line frequency power oscillations, which worsen Direct Current (DC)-link voltage ripples and stress DC-link capacitors. The well-known dq frame vector control technique, which is ...

As an important component of a PVPP, the PV inverter can convert the direct current (DC) generated from PV modules into the alternating current and then integrated into the grid. Mainly, according to the inverter topologies, the PV inverters can be classified into two categories: the central inverter and the string inverter (Desai et al., 2020 ...

This leads electrical stress on power switches, which may get damaged. While designing cascaded boost converter stage thermal and reliability aspects should be considered. Effect of sampling frequency on output voltage can be understood from the Figs. 7 and 8. Output distortion can be minimized using higher sampling frequency.

This undesirable leakage current is a consequence of variable high frequency common-mode voltage (CMV) of the inverter, which circulates between the neutral point of the ac grid and the parasitic capacitor of the negative terminal of the PV array, for which the parasitic capacitance value is around 100 nF per 1 kW [5, 6]. Consequently, a resonant path between ...

In order to reduce the sampling delay and improve bandwidth, stability margin, and the robustness of the active damping in LCL-filtered grid-connected inverters, real-time sampling provides a convenient method.
