

What happens if solar panels run at high voltages?

Strings of solar panels operate at high voltages, up to 600V or higher. Operating at these elevated voltages over many years can, in some cases, allow a current leak to develop through the cells to the aluminium frames of the solar panels and into the earth, resulting in a significant performance loss.

Why are my solar panels underperforming?

If your solar panels are underperforming, it's possible that the problem originated when the panels were being manufactured. Solar panels may be chipped or cracked in production, often signifying that the manufacturer did not use premium materials.

Why do solar panels fail?

Blown bypass diodes - Permanent failure often due to severe localised shading or overheating. Earth leakage is a common problem with older solar panels that is often caused by backsheet failure leading to water ingress or PID or potential induced degradation. Strings of solar panels operate at high voltages, up to 600V or higher.

What are the most common solar panel defects?

While some defects are treatable, such as electrical issues or unwanted animal activity around your panels, others require an inverter replacement or a whole module replacement if your system is chemically degrading. Check out our article on the most common solar panel defects for a deeper dive into what can go wrong.

How can I reduce my risk of underperforming solar panels?

Finding a reputable installer with high-quality solar panels is the first step in reducing your risk of underperforming solar panels. On the EnergySage Marketplace, you can compare multiple quotes from local, pre-screened installers to find the solar system that meets your needs at the right price.

How do I know if my solar panel is bad?

Solar panel fault-finding guide including examples and how to inspect and troubleshoot poorly performing solar systems. Common issues include solar cells shaded by dirt, leaves or mould.
