

How to plan a PV installation?

Surface Area: The surface area of the site at which the PV installation is intended should be known, to have an estimation of the size and number of panels required to generate the required power output for the load. This also helps to plan the installation of inverter, converters, and battery banks.

How to choose a solar installation site?

Thus, the following points must be considered for the assessment and selection of locations for installation. Minimum Shade: It must be made sure that the selected site either at rooftop or ground should not have shades or should not have any structure that intercepts the solar radiation falling on the panels to be installed.

How many solar panels rated for 160W?

Total WPeak of PV panel capacity = $3000 / 3.2$ (PFG) = 931 WPeak Now, the required number of PV panels are = $931 / 160W = 5.8$. This way, we need 6 numbers of solar panels each rated for 160W. You can find the exact number of solar panels by dividing the WPeak by other rating i.e. 100W, 120W 150W etc based on the availability.

How to choose a solar panel for a tilt roof?

In the case of tilt roofs, the angle of tilt must be known and necessary mounting must be used to make the panels have more incidents of solar radiation i.e. ideally the radiation angle must be perpendicular to the PV panel and practically as close as to 90 degrees.

How to calculate a solar panel charge controller rating?

Its current rating is calculated by using the short-circuit current rating of the PV module. The value of voltage is the same as the nominal voltage of batteries. The charge controller rating should be 125% of the photovoltaic panel short circuit current. In other words, it should be 25% greater than the short circuit current of solar panel.

How to calculate the size of a standalone PV system?

The size of the standalone PV system depends on the load demand. The load and its operating time vary for different appliances, therefore special care must be taken during energy demand calculations. The energy consumption of the load can be determined by multiplying the power rating (W) of the load by its number of hours of operation.
