electric heating systems with solar power is the environmental benefits it offers. By utilising solar energy to power the heating system, homeowners can significantly reduce their carbon footprint and contribute to a greener future. ...

A solar generator with a capacity below 2,000 watts may not be able to keep up with the electricity demand created by operating a space heater on its own. Why It Seems Challenging? The difficulty in powering a space heater with a solar generator stems from the high power consumption of space heaters.

An electric infrared heater of 1.21 kW (11 A/110 V) is used as the external heat source, and a thermostat is used to control the heating temperature. A K-type thermocouple is placed in the center of the electric infrared heater to monitor the heating temperature and the temperature data are recorded by a data logger.
