What is solar energy?

Solar energy is energy released by Solar cells are devices that convert light energy directly into electrical energy. You may have seen small solar cells in calculators. Larger arrays of solar cells are used to power road signs in remote areas, and even larger arrays are used to power satellites in orbit around the Earth.

What is a solar cell?

A solar cell (also known as a photovoltaic cell or PV cell) is defined as an electrical device that converts light energy into electrical energy through the photovoltaic effect. A solar cell is basically a p-n junction diode.

What is solar energy & photovoltaic cells?

In this article let us learn about solar power,solar energy,and photovoltaic cells in detail. Solar power is an indefinitely renewable source of energyas the sun has been radiating an estimated 5000 trillion kWh of energy for billions of years and will continue to do so for the next 4 billion years.

How is solar energy generated?

Solar energy - Electricity Generation: Solar radiation may be converted directly into solar power (electricity) by solar cells,or photovoltaic cells. In such cells,a small electric voltage is generated when light strikes the junction between a metal and a semiconductor (such as silicon) or the junction between two different semiconductors.

What is a solar-powered calculator?

A solar-powered calculator. Its solar cells are just above the buttons, on the right. These cells generate the energy needed to make the calculator work. (PaulPaladin / Alamy Stock Photo) You can see an example of solar cells on the top of some calculators.

How does solar energy work?

The water is heated by heat energy from the Sun and returns to the tank. In some systems, a conventional boiler may be used to increase the temperature of the water. Solar energy is a renewable energy resource and there are no fuel costs. No harmful polluting gases are produced. Solar cells do not work at night.

While there are many environmental factors that affect the operating characteristics of a PV cell and its power generation, the two main factors are solar irradiance G , measured in W/m^2 , and temperature T , measured in degree Celsius ($^{\circ}\text{C}$). The relation between these two factors and the PV operating characteristics can be modeled mathematically.
