The advantage of solar thermal is that the heated water can be stored until it is needed, eliminating the need for a separate energy storage system. [1] Solar thermal power can also be converted to electricity by using the steam generated from the heated water to drive a turbine connected to a generator.

Solar energy applications are found in many aspects of our daily life, such as space heating of houses, hot water supply and cooking. One major drawback of solar energy is intermittence [1]. To mitigate this issue, need for energy storage system arises in most of the areas where solar energy is utilized.

The four primary components of the solar thermal system include: the solar collectors, the storage tank, the solar loop and the control system. There is a relationship between the hot water consumption and collector area. Sizing a system will ultimately depend on the hot water consumption, climate and the efficiency of the collectors, which in
