Do solar panels comply with building regulations?

Your solar panel system must comply with building regulations in terms of structural integrity, electrical safety and fire safety. These regulations may vary depending on the size and type of the installation. It's advisable to work with accredited installers who are familiar with these requirements.

Are solar panels mandatory on new builds in the UK?

Solar panels aren't mandatory on new builds in the UK. However, other parts of the world have implemented requirements - in the EU, for example, solar panels will be mandatory on all new residential buildings by 2030.

When will solar panels be mandatory?

In March 2024, the European Parliament approved a law requiring solar panels on all new residential buildings by 2030. The EU Solar Standard makes it mandatory for member states to gradually include solar installations in new public, commercial, and residential buildings.

Are solar panels a legal requirement for new homes?

Even though installing solar panels on new builds is a great way to set new homes up with renewable energy from day one, it's not yet a legal requirement. One common problem is that developers don't use all the available roof space, resulting in a less effective solar panel system.

Do you need planning permission to install solar panels on your roof?

An increasing number of people are investing in solar energy. More and more homes are having solar panels, or solar tiles, installed on their roofs. Of course, with such installations, the topic of planning permission and building regulations often comes to the surface.

When did solar panels become a building regulation?

In 2005, household electrical work was absorbed into the UK government's official Building Regulations. A year later, the Climate Change and Sustainable Energy Act 2006 brought microgeneration systems like solar panels under the umbrella of the Building Regulations. Should you receive a building regulations certificate for your solar panels?

PV systems are most commonly in the grid-connected configuration because it is easier to design and typically less expensive compared to off-grid PV systems, which rely on batteries. Grid-connected PV systems allow homeowners to consume less power from the grid and supply unused or excess power back to the utility grid (see Figure 2 ).

The global cumulative capacity of PV panels reached 270 GW in 2015 and is expected to rise to 1630 GW by 2030 and 4500 GW by 2050, with projections indicating further increases over time [19].
